AI Systems Chief Architect | Distributed Systems & High-Performance Runtimes | Founder & MD

Mangaluru, Karnataka, India | Email: hrlinternationalprivatelimited@gmail.com | GitHub: github.com/hrlpavan | GitLab: gitlab.com/hrlpavan | LinkedIn: linkedin.com/in/hrlpavan

To: Engineering Leadership & Technical Talent Acquisition

Company: GitLab Inc. / GitLab India

Position: Staff Backend Engineer, India (Ref: 8775136002 / LinkedIn: 4471892845)

Dear GitLab Engineering Leadership,

I am writing to formally apply for the **Staff Backend Engineer** position in India. As the Founder, Managing Director, and AI Systems Chief Architect at HRL International Private Limited, I have led technical strategy, modular service decomposition, and high-performance infrastructure across 31+ software systems. I am deeply inspired by GitLab's architectural journey: modernizing the monolith toward clean, bounded contexts, scaling distributed Go services, guiding pragmatic Rust adoption, and establishing foundational guardrails for agentic AI engineering.

As an approved **GitLab Community Contributor (Issue #5499)** with active developer access across community forks and GitLab Duo, I already understand GitLab's asynchronous review mechanisms, Dangerbot automations, and architectural standards. Here is the strategic leverage I bring to GitLab at the Staff level:

- **Architectural Strategy & Modularization:** Extensive experience designing bounded service contexts, event-driven decoupled systems, and zero-bloat APIs. Adept at isolating failure domains, defining resilient schema evolution protocols, and migrating monolithic choke points without service disruption.
- **Systems-Level Depth (Go, Rust & C++):** Beyond standard web backends, I bring low-level systems engineering depth in memory virtualization, concurrency safety, and high-throughput pipelines. I can authoritatively evaluate where Go service patterns or Rust platform components yield measurable cost and latency gains.
- **Frontier Agentic AI Leadership:** I architect multi-agent orchestration systems and local inference suites (Paged KV-Cache virtual allocation, speculative decoding). Crucially, I balance AI productivity with rigorous engineering discipline — establishing verification harnesses, privacy boundaries, and validation guardrails so teams rely safely on AI output.
- **Influence Without Authority & Asynchronous Culture:** Author of comprehensive technical treatises, statutory engineering filings, and open architecture charters. I operate by transparent written proposals (RFCs), documented architectural decision records (ADRs), and empathetic code reviews that mentor and elevate engineering throughput across teams.

At the Staff level, success is about leverage — multiplying the velocity, security, and operational resilience of adjacent teams. I look forward to discussing how my systems background, architectural vision, and passion for open-source DevSecOps can help shape GitLab's platform roadmap.

Sincerely,

Pavan Kumar Sadashiv
